AMENDMENTS TO THE CLAIMS

The following listing of claims will replace all prior versions and listings of claims in the application.

LISTING OF CLAIMS

1. (Currently Amended) A lateral bipolar CMOS integrated circuit comprising: an inverter circuit comprising an n-channel MOS transistor and a p-channel MOS transistor, and having four terminals of:

a gate input terminal connected with the gates of the n-channel MOS transistor and the p-channel MOS transistor;

an output terminal connected with the drains of the n-channel MOS transistor and the p-channel MOS transistor;

a p-type base terminal connected with a p-type substrate of the n-channel MOS transistor; and

an n-type base terminal connected with an n-type substrate of the p-channel MOS transistor,

wherein the n-channel MOS transistor operates in a hybrid mode which is the hybrid of an operation mode of the MOS transistor and an operation mode of an npn lateral bipolar transistor which is inherent in the n-channel MOS transistor, and

the p-channel MOS transistor operates in a hybrid mode which is the hybrid of an operation mode of the MOS transistor and an operation mode of a pnp lateral bipolar transistor which is inherent in the p-channel MOS transistor;

a current source connected with the p-type base terminal of the n-channel MOS transistor; and

wherein currents from the current source connected with the p-type base terminal of the nchannel MOS transistor and the correct source connected with the n-type base terminal of the pchannel MOS transistor are maintained at about 0 when the input voltage to the gate input
terminal is approximately constant at a high level and constant at a low level.

2. (Previously Presented) The lateral bipolar CMOS integrated circuit according to claim 1, wherein the gate input terminal, the p-type base terminal and the n-type base terminal are input terminals of the inverter circuit, and the output terminal is an output terminal of the inverter circuit, and

the inverter circuit outputs, at the output terminal, a high-level or low-level voltage fed to the gate input terminal as an inverted level voltage.

3. (Currently Amended) The lateral bipolar CMOS integrated circuit according to claim 2,

wherein currents from the current source connected with the p-type base terminal of the n-channel MOS transistor and the current source connected with the n-type base terminal of the p-channel MOS transistor are maintained at 0 when the input voltage to the gate input terminal is approximately constant at a high level or low level,

when the input voltage to the gate input terminal switches from the low level to the high level, a forward pulse current flows from the current source connected with the p-type base terminal of the n-channel MOS transistor to the p-type base terminal in synchronization to switching, and

when the input voltage to the gate input terminal switches from the high level to the low level, a forward pulse current flows from the current source connected with the n-type base terminal of the p-channel MOS transistor to the n-type base terminal in synchronization to switching.

4. (Previously Presented) The lateral bipolar CMOS integrated circuit according to claim 3, further comprising a voltage source and a ground source,

wherein the current source connected with the p-type base terminal of the n-channel MOS transistor is formed by a pull-up p-channel MOS transistor comprising a source terminal, a drain terminal and a substrate terminal, the drain terminal is connected with the p-type base terminal, and the source terminal and the substrate terminal are connected with the voltage source, and

the current source connected with the n-type base terminal of the p-channel MOS transistor is formed by a pull-down n-channel MOS transistor comprising a source terminal, a drain terminal and a substrate terminal, the drain terminal is connected with the n-type base terminal, and the source terminal and the substrate terminal are connected with the ground source.

5. (Previously Presented) The lateral bipolar CMOS integrated circuit according to claim 1,

wherein the inverter circuit comprising the n-channel MOS transistor and the p-channel MOS transistor is used as a CMOS standard cell in the operation mode of the MOS transistor,

but is used in the hybrid mode when a large load is connected with an output from the CMOS standard cell.

6. (Previously Presented) The lateral bipolar CMOS integrated circuit according to claim 2,

wherein the inverter circuit comprising the n-channel MOS transistor and the p-channel MOS transistor is used as a CMOS standard cell in the operation mode of the MOS transistor, but is used in the hybrid mode when a large load is connected with an output from the CMOS standard cell.

7. (Previously Presented) The lateral bipolar CMOS integrated circuit according to claim 3,

wherein the inverter circuit comprising the n-channel MOS transistor and the p-channel MOS transistor is used as a CMOS standard cell in the operation mode of the MOS transistor, but is used in the hybrid mode when a large load is connected with an output from the CMOS standard cell.

8. (Previously Presented) The lateral bipolar CMOS integrated circuit according to claim 4,

wherein the inverter circuit comprising the n-channel MOS transistor and the p-channel MOS transistor is used as a CMOS standard cell in the operation mode of the MOS transistor, but is used in the hybrid mode when a large load is connected with an output from the CMOS standard cell.
